WILLIAM JONES COLLEGE PREPARATORY HIGH SCHOOL

CHICAGO The William Jones College Preparatory High School is located on a compact 100- by 400-foot site just south of Chicago's Loop. The design by the Chicago office of Perkins+Will is a vertical solution that stacks large and small spaces within 278,000 square feet. Classrooms run the length of the building on the fourth and fifth floors, linked to major gathering spaces through the lobby and a commons that rises the height of the structure from the main entrance. The primary spaces requiring long-span solutions—the natatorium and the gymnasium—are located at the top, where outdoor terraces provide students and spectators with views of Grant Park to the east. The mix of uses is expressed on the highly varied exterior façade of unitized curtainwall, composite metal panel rainscreen cladding, and insulated precast concrete panels—visually integrated through a regular pattern of GFRC precast covered columns. **█.█.**

HENDERSON-HOPKINS SCHOOL

BALTIMORE Located on a two-city-block site in Baltimore's Middle East neighborhood, the Henderson-Hopkins School, designed by New York-based Rogers Partners, is a 125,000-square-foot learning community for students in kindergarten through eighth grade. Run by neighboring Johns Hopkins University and Morgan State University as part of Baltimore's public school system, the school is divided into five small learning groups, or houses. Each accommodates up to 120 students in separate structures that have classrooms, flex spaces, and a commons. These low-slung, grooved precast panel-clad volumes are connected visually through large windows, and physically, by an open-air learning terrace at the center of the site. The project also includes an early childcare center and community amenities—including a library, gym, auditorium, and family resource center—which surround the school houses, creating a campus that will serve area residents throughout every stage of their lives. **█.█.**

"This was the transformation of a whole district. The scale of it is really incredible."
—Jennifer Yoos
